as how to make and process them. That said, as explained in Chapter 3, the requisite material properties that are to be optimized cannot be measured by the usual quasi-static measures of mechanical behavior. However, even at lower strain rates, conducting mechanical tests at small scale—that is, at the microstructural level, on the order of nanometers or microns—will likely shed light on ...

In materials science, creep (sometimes called cold flow) is the tendency of a solid material to move slowly or deform permanently under the influence of persistent mechanical stresses. It can occur as a result of long-term exposure to high levels of stress that are still below the yield strength of the material. Creep is more severe in materials that are subjected to heat for long periods and ...

The J-integral represents a way to calculate the strain energy release rate, or work per unit fracture surface area, in a material. The theoretical concept of J-integral was developed in 1967 by Cherepanov and in 1968 by Jim Rice independently, who showed that an energetic contour path integral (called J) was independent of the path around a crack. ...

Korrosion (från latinets *corrodere* som betyder fräta sönder) [1], frätning, innebär att ett material, vanligtvis en metall, löses upp genom en kemisk, oftast elektrokemisk, reaktion till en mer stabil form, som exempelvis oxider, hydroxider och sulfider. [2] Även andra material än metaller, såsom plaster eller keramer, kan korrodera. I dagligt tal syftar man dock vanligen till ...
